AI Cockpit — Enterprise vs. Pilot Governance Guide

Autonomous Agent Portfolio Governance & Financial Valuation

1. Dual-Cohort Architecture: Enterprise View vs. Pilot View

The AI Cockpit provides two views via the top-level navigation toggle:

🧪 Pilot View (4 Live Bots)

- **Purpose:** Client proof-of-concept, live interactive agent execution, and real-time Azure OpenAI telemetry.
- **Scope:** Dedicated live bots in IT Service Desk, Supply Chain, AP Invoices, and HR.
- **Telemetry:** Live token usage, per-user response latency, active employee session logging, and live chat launch.
- **Scale:** $1.2k – $3.5k monthly net value; early adoption & accuracy proof.

🏢 Enterprise View (1,200 Agents)

- **Purpose:** Demonstrates macro organizational impact, labor capacity unlocking, and FinOps budgeting at scale.
- **Scope:** 1,200 autonomous agents across 35 teams and 6 business functions (Engineering, Sales, CS, HR, Finance, Operations).
- **Telemetry:** Real-time telemetry for live bots + consistent enterprise telemetry across the broader fleet.
- **Scale: $18.2M+ Annualized Net Value** (~$1.52M/mo) and **~83,345 hours saved/mo** (~520 FTEs unlocked).

Dimension	Pilot View (4 Live Agents)	Enterprise View (1,200 Agents)
Live Agent Links	Active `[Live Agent ↗]` buttons direct to running container web apps (Copilot Studio, IT Service Desk).	Live links strictly restricted to the 2 demo bots; enterprise fleet displays clean catalog metrics.
Monthly Labor Unlocked	~120 – 350 hours / month (~0.8 – 2.2 FTEs).	**~83,345 hours / month (~520 FTEs capacity unlocked).**
Cost Tracking	Real Azure OpenAI tokens ($2.50/M input, $10.00/M output) + Copilot Capacity Packs ($200/mo).	Full enterprise breakdown: License seats, token consumption, platform infra, and enablement fees.

2. The 4-Tier Agent Governance Decision Matrix

Every autonomous agent in the cockpit is audited continuously and assigned one of four governance action statuses:

Status	Trigger Condition / Parameter	What It Means & Required Action
🧪 Experiment	`Days in Production < 60 days`	Agent is newly deployed and still collecting early production telemetry, usage patterns, and user feedback.
🚨 Intervene	**Triggered if ANY of these fail:** • Policy Incidents > 0 • Cost vs. Budget > 110% • Eval Pass Rate < 88% • Net Value < $0 (Negative ROI)	Safety violation, prompt degradation, budget overrun, or value destruction requiring root cause intervention. Engineering reviews prompts, guardrails, or applies semantic caching.
🚀 Accelerate	`Net Value ≥ $2,500/mo` **AND** `Workforce Adoption ≥ 70%` *(with Eval ≥ 88%, Incidents = 0, Cost ≤ 110%)*	Proven top performer with high workforce adoption and significant ROI ready for enterprise scaling and multi-region rollout.
⚙️ Optimize	Operates safely within normal envelope (Eval ≥ 88%, Cost ≤ 110%, Incidents = 0), but Net Value is under the $2,500 threshold to qualify for Accelerate.	Standard healthy production status. Focus is on fine-tuning prompts, latency, and token caching.

3. Financial & Labor Valuation Formulas

1. Hours Saved (Labor Capacity Returned)

```
Hours Saved = Total Successful Runs × Baseline Task Time (hours)
```

2. Gross AI Value ($ USD)

```
Gross Value = Hours Saved × Blended Employee Hourly Rate ($40.63 / hr)
```

3. Total AI Run Cost ($ USD)

```
Total Cost = Token Consumption (55%) + Cloud Platform & Infra (24%) + Vector RAG (13%) + Safety Guardrails (8%)
```

4. Net AI Value ($ USD) & Return on Investment (ROI)

```
Net Value = Gross Labor Value - Total AI Cost
```

```
ROI (%) = (Net Value ÷ Total Cost) × 100%
```

5. FTE Capacity Equivalent (Full-Time Employees Unlocked)

```
FTE Unlocked = Total Hours Saved ÷ 160 hours/month
```

4. Why These Values? (Enterprise Benchmarks & Rationale)

All enterprise values are calibrated against standard corporate labor benchmarks and public cloud pricing models:

Metric	Enterprise Value	Underlying Benchmark & Reasoning
Blended Hourly Rate	**$40.63 / hr**	**$6,500/month salary ÷ 160 working hours.** Represents a standard $78,000/yr corporate knowledge worker base salary (IT analysts, supply chain coordinators, AP clerks). Intentionally conservative so finance leaders don't question inflated ROI.
Hours Saved	**~83,345 hrs / mo**	**~69.4 hours/month per bot (~3 hours of manual effort saved per bot per day).** Aligns with standard enterprise AI benchmarks for routine task automation (email/ticket triage, inventory lookup, document drafting).
FTE Capacity Unlocked	**~520 FTEs**	**83,345 hours ÷ 160 standard working hours/month = ~520.9 FTEs.** Represents repetitive manual labor capacity returned to employees so they can focus on core strategic priorities without headcount expansion.
All-Inclusive AI Costs	**~$1.86M / mo**	**Calculates complete cloud infrastructure, not just LLM tokens:** • **Model Tokens (55%):** Raw multi-model LLM prompt & completion inference. • **Cloud Platform & Infra (24%):** Azure Container Apps, Kubernetes node pools, microservices, compute. • **Vector RAG & Pipelines (13%):** Vector database embeddings, enterprise indexing, connectors. • **Safety & Guardrails (8%):** Prompt injection firewalls, PII redaction, audit logs.
Net AI Value & ROI	**~$18.2M / yr (82% ROI)**	**Gross Labor Value ($3.38M/mo) − Total AI Cost ($1.86M/mo) = ~$1.52M/mo net.** Returns ~$1.82 in labor value for every $1.00 invested in AI, directly matching top-quartile enterprise GenAI deployments.
